SUMMARY

Software engineer on a help desk and ticketing platform — Django and React in production, plus a C# desktop application. Seven months on a live ICT service desk before that. I build things end to end and ship them.

EXPERIENCE

Software Engineer — SafariDesk March 2025 – Present

Help desk and ticketing platform — shared inbox, SLA controls, email-to-ticket intake, knowledge base. One of nine engineers; third-highest contributor across both the backend and the frontend.

- Rebuilt transactional email so every message renders against the customer's own branding, moving all templates onto a shared base with structured HTML, logging and error handling.
- Replaced per-model real-time logic across tickets, tasks, contacts and requests with a single generic broadcast layer.
- Found and fixed a multi-tenant isolation defect where workspace cache persisted across a business switch; added business-scope validation to password reset.
- Built the knowledge base frontend end to end, then rebuilt it as a documentation-style help centre; added OAuth token refresh for Google and Microsoft mailbox connections.

Safe Redact *(sibling product, June 2026 – present) — Windows application that removes personal data from documents, images, audio and video, with all inference running locally.*

- Diagnosed a native dependency conflict where two NuGet packages shipped competing builds of `onnxruntime.dll` to the same path, silently forcing every AI detector onto CPU while the startup check still reported GPU acceleration available.
- Built the redaction workflow — canvas editing, page split/merge/rotate, word-level coverage tracking — with xUnit coverage across five projects.

Industrial Attachment, ICT & Telecommunications — Kenya Power January – July 2024

- Frontline Windows support across the Central Rift region — diagnosed and resolved hardware, software and application faults for non-technical staff.
- Monitored the service desk and reported on resolution times; maintained LAN/WAN infrastructure, Cisco routers and switches, and VHF/HF radio systems.
- Built an internal device check-in/check-out system, replacing a manual equipment loan record.

PROJECTS

Ellie — local-first meeting notetaker, Windows and Android. C#, .NET, Windows App SDK, MAUI, whisper, llama.cpp

- One twelve-project codebase producing a signed MSIX installer and a signed Play bundle, with transcription and summarisation running entirely on-device; recording pipeline built around failure, using separate audio tracks with crash-recoverable chunked storage.

Boval — multi-tenant booking platform. FastAPI, PostgreSQL, Next.js, React, Docker

- Built solo: branded per-business booking pages, an embeddable widget, subscription plan-limit enforcement, multi-currency pricing and IP-aware rate limiting.

Nyukiwatch — offline-first apiary management. Fastify, PostgreSQL, MinIO

- Built for sites without mobile signal: every submission carries a client idempotency key and a queued timestamp, so six offline records sync as exactly six.

Further work across ~99 repositories — see portfolio.

SKILLS

Languages	Python · TypeScript / JavaScript · C# · SQL
Backend	Django · FastAPI · Node.js · PostgreSQL · REST API design · multi-tenant architecture
Frontend	React · Next.js · Tailwind · Vite
Desktop	.NET · WPF · Windows App SDK · MAUI
Tooling	Docker · GitHub Actions · nginx · Git · Linux

EDUCATION

Diploma in Computer Programming — The Co-operative University of Kenya 2022 – 2025

U.S. equivalency: Associate of Science, 60 semester credits, 3.10 GPA — SpanTran / The Evaluation Company (NACES), 2026.

CERTIFICATIONS

AWS re/Start Graduate · IBM Cybersecurity Fundamentals · Power Learn Project — Software Engineering & Full-Stack Development · Cisco Python Essentials · freeCodeCamp Front-End Development — verify on Credly
